

Interaction-based model did not improve response prediction

Retrospective reanalysis of published fly experiments | 18 genotypes | one study

NOT_SUPPORTED | randomization p = 0.487

Responses are pooled source means of normalized TH-positive innervation area. Missing vial/batch identifiers prevent animal-level inference.
Drug preference is not proof of benefit. Prediction failure does not invalidate the authors' intervention results. Source: Kaempfer et al., 2026.
