

NAA25 knockdown reveals a synaptic-protein selectivity concern

Human iNeuron proteomics · 5 control and 5 knockdown culture samples · retrospective reanalysis

Bars: Welch 95% confidence intervals. Protein FDR: SYP 0.024; SYT1 0.034 (4,511 proteins tested).
SNCA: one peptide, 5 vs 4 observed samples. Panel preservation concerns relative abundance, not enzyme or synaptic activity.
Source: Santhosh Kumar et al., Science Advances (2024), Table S5. The frozen selectivity gate did not pass.

Exact two-sided p = 0.00794
Exploratory contrast; dots are culture samples
