

The SYT1 decrease survives complete-peptide reanalysis

Sensitivity analyses of peptide coverage, charge-state weighting and sample influence.

A Protein estimates with 95% intervals

**B Complete SYT1 peptides
All 14 point downward**

SYT1: 63% lower in the complete-peptide analysis; FDR = 0.038 across 2,183 eligible proteins.

Both proteins and the neuronal-panel effect remain negative after every single-sample omission.

Peptides are repeated measurements of the same samples, not 14 independent experiments. SYP fails the strict coverage gate.

These checks are post hoc within-study robustness analyses. They do not establish independent replication or impaired neurotransmission.
